

There is no GREEN ENERGY without a GREEN GRID

California is leading the way towards a green energy future.

To fight back against the impacts of climate change, California has established a clear, bold energy goal: 50 percent renewable energy by 2030. And PG&E is helping the state surpass its goals by voluntarily committing to reach 55 percent by 2031.

However, we can't reach our bold energy goals without a grid that is able to deliver clean energy to every corner of California. The US electric grid has been called the world's largest machine, and the National Academy of Engineering has called it one of the greatest engineering achievements of the 20th century.

In order to make the grid work for our clean energy future, we must modernize the grid to make it more dynamic, resilient and capable of delivering even higher levels of renewables.

At PG&E, we've invested \$15 billion over five years to enhance and strengthen the grid. We've made a wide range of improvements, from the operations of new distribution control centers to the building of a smarter energy infrastructure to advances in forecasting and emergency planning.

A green energy future is within our reach. Let's work together to get there.

CALIFORNIA'S
ENERGY
GOAL BY 2030:
50%
RENEWABLE
ENERGY

PG&E HAS
ALREADY
SURPASSED
33%
RENEWABLE
IN ENERGY MIX

PG&E HAS
INVESTED
\$15
BILLION
TO ENHANCE
OUR GRID
